

The **ascom** Berkshire SD30 Telephone –
compatible with leading headsets

The Berkshire SD30 Telephone – flexibility with reliability

*Headsets are now widely accepted as essential equipment for telephone users who regularly handle a high call volume. The benefits in comfort, productivity and noise reduction are so strong that a headset telephone is the obvious choice for call-centre/teleworker environments. The **Berkshire SD30 Telephone** offers headset compatibility with **Berkshire** functionality.*

Ease of Use

The flexible nature of the **Berkshire SD30** gives users the option of answering and making calls, using either the handset or a headset. The headset option is simple to operate, being activated at the press of a button to either answer or make a call and deactivated at the end of the call, by pressing the same button. Swapping a call from handset to headset is easily achieved by a single button press; alternatively a call may be passed from headset to handset simply by raising the handset, as this switches off the headset.

Additional Benefits

The headset option allows the telephone user to deal with calls in a confidential manner, whilst having both hands free to execute tasks, such as the input or retrieval of data, without having to juggle a telephone handset at the same time. There is also the benefit of easy to use telephone functions.

Headset Compatibility

The **Berkshire SD30** is suitable for use with most leading headsets.

As headset specifications vary, please check with your supplier that the selected headset is compatible. A list of compatible headsets is available on request.

Feature	SD 30
